

WHAT IS CLAIMED IS:

1. A wrench structure, comprising a wrench body having a handle portion, wherein:

the handle portion is formed with a reinforcement portion;

5 the reinforcement portion has a first side formed with a first holding portion and a second side formed with a second holding portion; and

the first holding portion has a plane inclined with that of the second holding portion.

2. The wrench structure in accordance with claim 1, wherein the
10 reinforcement portion has an enlarged diameter to strengthen the structural strength of the handle portion.

3. The wrench structure in accordance with claim 1, wherein the plane of the first holding portion is vertical to that of the second holding portion.

15 4. The wrench structure in accordance with claim 1, wherein the wrench body is integrally formed with the reinforcement portion, the first holding portion and the second holding portion.

5. The wrench structure in accordance with claim 1, wherein the first holding portion has a distal end provided with a closed driving head.

20 6. The wrench structure in accordance with claim 1, wherein the second holding portion has a distal end provided with an opened driving head.

7. The wrench structure in accordance with claim 1, wherein the first holding portion has a bent portion located adjacent to the reinforcement portion.

8. The wrench structure in accordance with claim 7, wherein the
5 plane of the first holding portion is vertical to that of the second holding portion by the bent portion.

9. The wrench structure in accordance with claim 1, wherein the handle portion of the wrench body has two distal ends each formed with an opened driving head.

10 10. The wrench structure in accordance with claim 1, wherein the handle portion of the wrench body has two distal ends each formed with a closed driving head.
